

Prevent the spread of Freshwater Pests:

Didymo is a microscopic pest that can be spread by a single drop of water. Unfortunately it is fairly widespread in the Otago Region. Please be vigilant when travelling between waterways and especially between regions. The North Island is Didymo free. Always check, Clean, and Dry anything that has come into contact with freshwater.

For detailed information and specific cleaning guidelines refer to the Ministry of Primary Industries website at <http://www.biosecurity.govt.nz/pests/didymo/cleaning>
